

Patient Care Group Logbook

Purpose

The purpose of this activity is for the entire cohort of trainees to learn from each client's abortion even if not directly caring for the client.

Materials

- Flipcharts
 - Attach several flipcharts together in order to create a large logbook to place on the classroom wall and maintain this for the entirety of the training. See logbook activity for a sample logbook
- Markers

Timeline

Discussion of each client typically takes 5 minutes.

Instructions

Regroup in the training room after conducting each client assessment. Have each team "present" their client or provide an update. Another trainee or the facilitator can simultaneously complete the classroom logbook. Engage the group in documenting when the next dose of misoprostol should be given, if pain medication should be re-dosed, and/or what contraceptive method has been chosen. Sharing of cases allows the trainees to learn from all the clients as well as aids the clinical trainer in tracking and monitoring the clients. See *Guidance & logistics for training in direct patient care* (part of this curriculum) for further details regarding how this activity fits into training.
